

GET MORE OUT OF YOUR 24 OR 32 CARRIER BRAIDER

32 Carrier machines are compatible with 16 carrier heads!

Over the past year there has been an increase in demand for 24 or 32 carrier machines. Many of our customers look to differentiate themselves for their competitors. This usually results in variations of product OD, different braid patterns for additional track-ability or even flex manufacturing capacity with a machine that may not be fully utilized.

In order to support our customer's development, Steeger USA wanted to inform our customers about our modular machines that can be utilized for flex manufacturing capacity and research and development opportunities. The modular machine frame utilizes the same footprint as our standard horizontal 24 and 32 carrier machines. This newly designed machine can accept an 8, 12 or 16 carrier head with very little floor space required. The modular machine's simple bolt up/ plug and pay design requires minimal changeover time from equipment maintenance teams.

In addition to the floor spaced saved with the modular machine, the total cost of a 32-carrier machine with an additional 16-carrier head is thousands of dollars less expensive than investing in a separate 16-carrier and 32-carrier machine. For those customers with lower volume requirements, this may be an ideal solution to expand internal capabilities and limit capital investment.
